

Who Is Wired CIO

"When your technology works, so do your people." — what every SDR needs to know cold before the first dial.

Overview

Wired CIO builds the IT department of the future: one Microsoft-aligned partner to grow, protect, automate, and align a business. We're an IT partner for growing businesses — fully managed or co-managed, built on the Microsoft cloud, and accountable for the whole stack, not just the help desk.

Founded by Russell, a technology leader with 15 years of IT experience and deep Microsoft expertise. The company exists because of a gap he saw firsthand: large enterprises run IT with reporting trees of eighty-plus specialists — help desk, system administrators, security engineers, and more — but growing companies need most of those same capabilities and can't field that full roster themselves. That's the gap Wired CIO fills.

Headquartered in Chicago, also serving the Cincinnati market. Core values: transparency, continuous improvement, and a solution-first mindset — proactive strategy, not reactionary fixes.

Why This Is a Different Pitch Than "We Do IT Support"

Most traditional IT contracts cover day-to-day tickets and nothing else — strategy, applications, security, and compliance sit outside the scope, handled ad hoc or not at all. Wired CIO's scope is strategy, operations, security, applications, and compliance from one accountable team.

A dedicated vCIO owns the technology roadmap so a client's IT evolves with the business instead of reacting to it after something breaks — this is a strategic relationship, not a vendor relationship.

Wired CIO is the single point of contact for every technology vendor — ISPs, SaaS providers, hardware vendors — and owns their tickets directly, so the client's own team stops chasing support lines.

Key Facts — Know This Cold

- Tagline: *"When your technology works, so do your people."*
- Full service line-up: Managed IT Services, Cybersecurity, Cloud Services, IT Consulting & Advisory, Backup & Disaster Recovery, Compliance Services, Vendor Management, and Technical Training & Support — plus, covered elsewhere in this playbook, Dynamics 365 (ERP/CRM) and Custom Application Development.
- ICP: growing small-to-midsize businesses that need enterprise-grade IT capability without hiring an enterprise-sized internal team. Named industries include Small Business, Manufacturing, and Healthcare (HIPAA/compliance-driven).
- Pricing model: a flat monthly rate per person, which covers their primary device — shared and additional devices are a small add-on. Simple and predictable; never quote a specific number cold, that comes after Discovery.
- Engagement structure: a rolling 90-day commitment, not a multi-year lock-in — "we earn your business every quarter." A strong, disarming answer to the "long contract" objection.
- Sales motion: Discovery (ballpark scope and budget shared early, no signature expected) → Design → fixed-scope pricing, presented two ways side by side — a straight hourly project, or the same scope amortized monthly with support included.

Be Ready to Answer These (Prospects Will Ask)

1. "How is this different from just hiring an IT person?" — Point to the comprehensive scope: strategy, security, applications, and compliance from one accountable team, not just a warm body closing tickets.
2. "What's the contract length?" — A rolling 90-day commitment, not a multi-year lock-in.
3. "How much does this cost?" — Flat monthly rate per person, covering their primary device. Give a real ballpark only after Discovery, never a number cold.
4. "Are you a Microsoft shop, or can you work with anything?" — Microsoft-aligned by design: M365, Azure, and Dynamics 365 are the whole-stack story.
5. "We already have IT — why would we need you?" — Find out if there's real co-managed potential (see that sheet) before assuming this has to be a full replacement conversation.

Objection Handling

If they say...	Ask / respond with...
"That sounds expensive."	Reframe around the flat per-person rate and the 90-day commitment — no long-term risk,
"We like our current IT person/provider."	Ask what's NOT covered today — strategy, security, compliance, applications are the gaps
"We don't have time for a call right now."	Acknowledge it, then ask for a specific window instead of "send me info" — log a real follow
