Outbound Execution Playbook

How an SDR performs and executes an outbound call — from dial to booked Discovery.

Overview

An SDR's job on an outbound call is narrow and specific: qualify fit and interest fast, using the language in this playbook, and book a Discovery call. You are selling the next step — a 20-30 minute Discovery conversation — not the IT services themselves. Don't over-pitch on the first call.

Every lead an SDR works has already been triaged by Wired CIO's own detection engine into a tier (Strong Signal / Needs Review / Bad Lead) and a product-line category (Dynamics 365 or M365/Azure) before it ever reaches a dial list. Know which tier and category a lead landed in before you call — it tells you which service-line sheet in this library to have open.

Call Flow

- 1. Open on their situation, not our services.** Mirror the trigger that got them on the list (a stated pain point, a piece of language from their form fill or CSV notes) — don't lead with a features pitch.
- 2. Confirm the trigger.** What changed, or what are they actively dealing with right now? This is where you find out if the signal that qualified them is still real.
- 3. Run the category-specific discovery questions** from the matching service-line sheet (Dynamics 365, MSP, Custom App Dev, Licensing, etc.).
- 4. Qualify against the tier framework below** before you ask for the meeting — don't book a Discovery call on a lead that's really a Bad Lead in disguise.
- 5. Book Discovery and set expectations.** Wired CIO comes back with a ballpark scope, not a hard sell — no signature expected at that stage. That's an easy, low-pressure ask.

Qualify Like the Scanner Does

- + Strong Signal: a real trigger (a stated pain point, timeline, or event) PLUS a real number, timeline, or named decision-maker. Book Discovery now.
- + Needs Review: real interest, but missing a number, timeline, or clear owner. Ask one more qualifying question before booking, or log a specific, dated follow-up rather than letting it drift.
- + A confirmed seat/user count of 15+ is the internal strong-signal bar for licensing and Dynamics conversations — smaller confirmed counts still get worked, just at lower priority.

Auto-Disqualify Language — Master List

- x Single-seat / freelancer language — not a real seat-count opportunity.
- x A flat rejection: "not interested," "unsubscribe."
- x "We're happy with our current provider" / locked into an existing contract.
- x Personal, non-business use.
- x A one-off basic support issue (password reset, locked out) — a ticket, not a relationship opportunity.
- x They want Microsoft's own direct support, not a partner/reseller.

- x Internal CRM/Opportunity notes describing a deal someone else already owns — third-person pipeline language, not a fresh lead's own interest.
- x Small one-off project or free-advice language: "pick your brain," "free consultation," "no budget," "not looking to hire/engage/pay."

Objection Framework (Generic — See Each Sheet for Specifics)

If they say...	Ask / respond with...
"How much does this cost?"	Never quote a number cold. Explain the model (flat monthly rate per person, 90-day rolling
"We already have someone."	Find out if it's a full replacement "no," or a co-managed gap — don't assume. See the Co-
"Just send me some info."	Treat as a soft no. Get one more qualifying answer before agreeing, and lock a specific fo
"Not the right time."	Ask what would need to change, and when their next budget/planning cycle starts. Log a n

Handoff — What a Booked Discovery Call Needs

Company name, contact, the product-line category (Dynamics 365 / M365-Azure / MSP / Custom App Dev / etc.), the tier you qualified them at, and the specific trigger language they used on the call. That's what becomes the account team's opening line in Discovery — don't let it get lost in a generic handoff note.
